T90 Distribution

Kouveliotou et al., 1993

T90 Distribution - Instrumental Effects

Project Goal

To determine if the measured T90 durations of GRBs observed with *Swift*/BAT are accurate approximations of their true durations

Instrumental Considerations- SVOM/Eclairs

Fig. 9 Detection ratio (the ratio between the number of positions at which the burst is detected and the number of simulated positions) for each of the 10 ulGRBs as a function of $\cos \theta$.

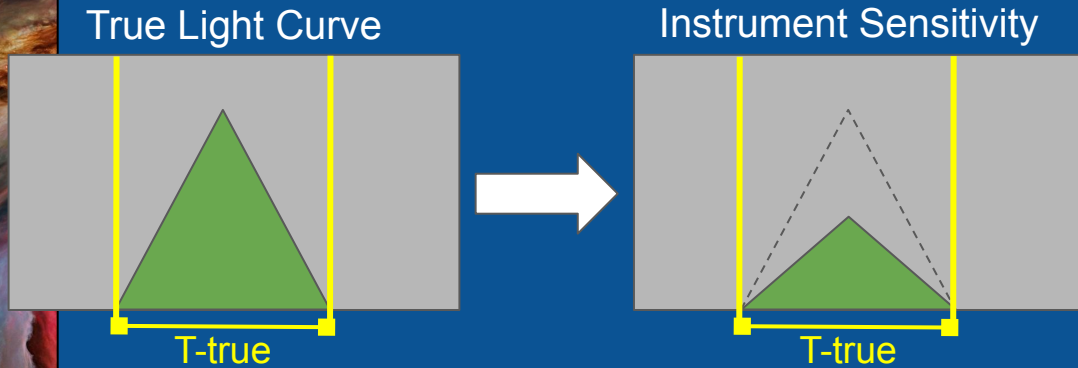

Fig. 16 Detection fraction (the ratio between the number of positions at which the burst is detected and the number of simulated positions) for each of the 10 ulGRBs according to the redshift.

Swift/BAT Instrumental Parameters

Relevant Parameters:

- **Number of Active Detectors (NDETS)**
- Incident angle (PCODE)
- Background

Not Relevant:

- Energy band

Lien A. et al., 2014

Swift/BAT Instrumental Parameters

Relevant Parameters:

- Number of Active Detectors (NDETS)
- **Incident angle (PCODE)**

- Background

Not Relevant:

- Energy band

Lien A. et al., 2014

PCODE and Incident Angle

Incident Angle = 0 deg
PCODE = 1

PCODE and Incident Angle

Incident Angle = 29 deg
PCODE = 0.5

PCODE and Incident Angle

Incident Angle = 50 deg
PCODE = 0.04

PCODE vs BAT Field of View

Not exactly one-to-one with incident angle

Swift/BAT Instrumental Parameters

Relevant Parameters:

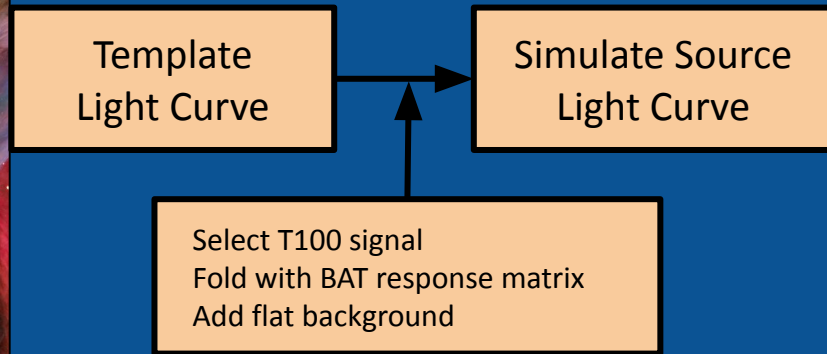

- Number of Active Detectors (NDETS)
- Incident angle (PCODE)
- Background

Not Relevant:

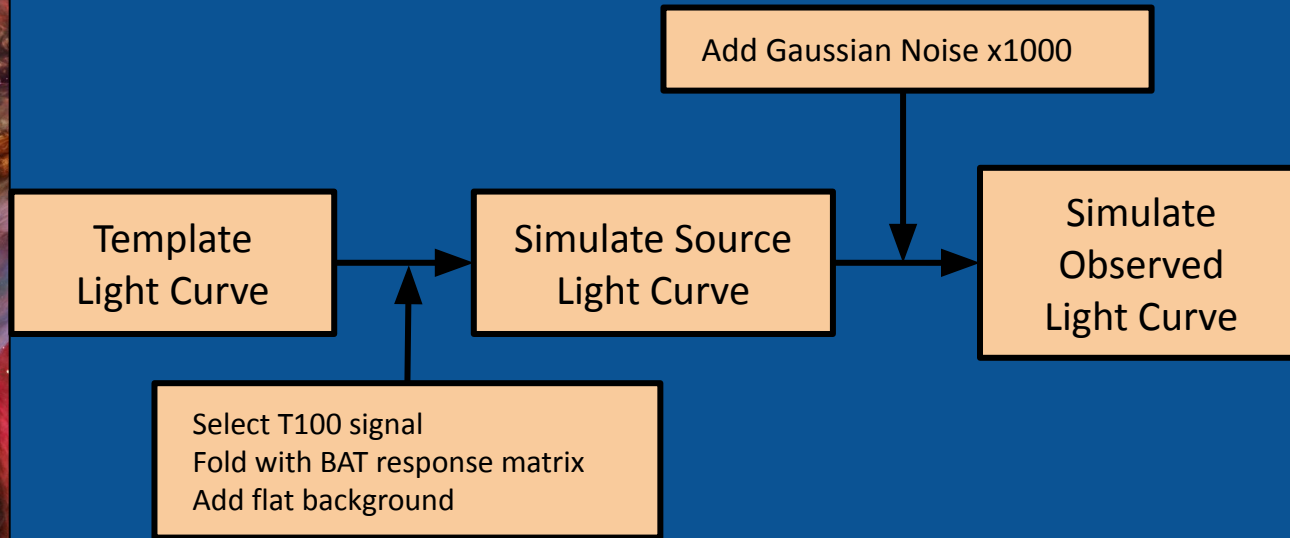

- **Energy band**

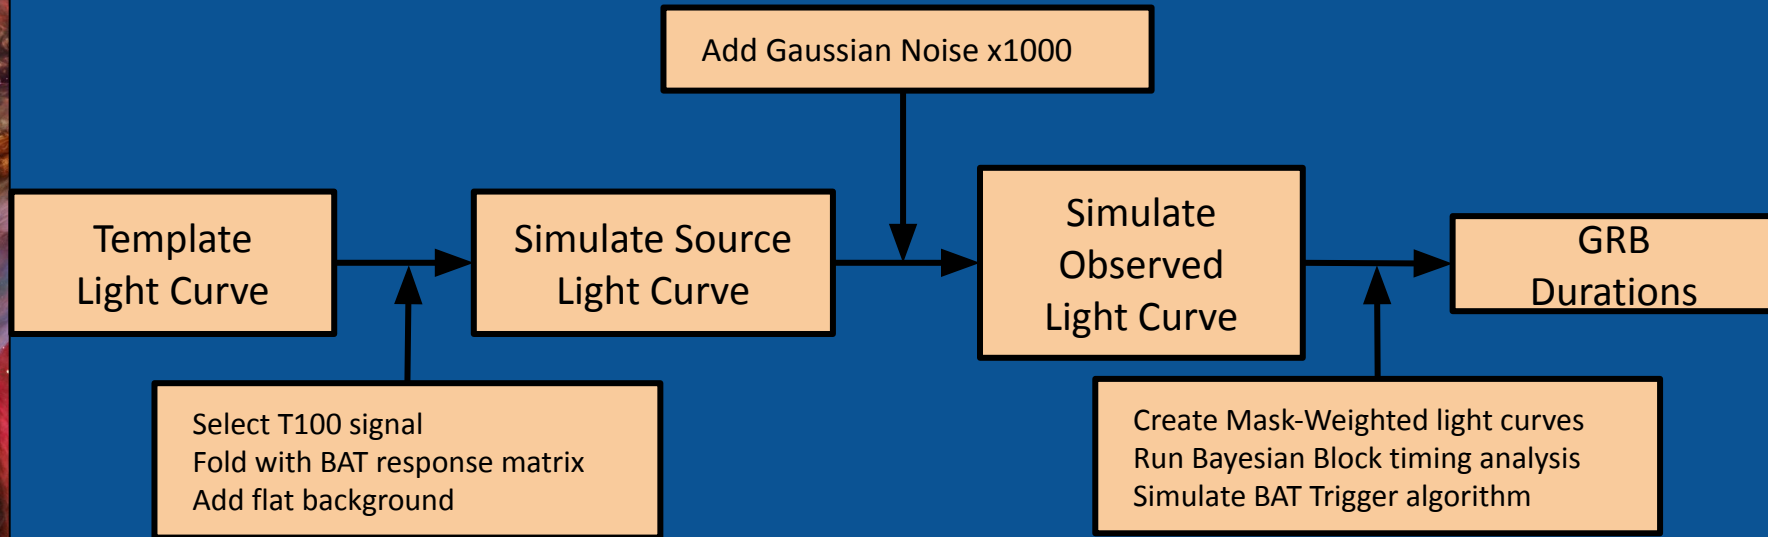

Simulation Method Summary

Simulation Method Summary

Simulation Method Summary

$$I(t) = A\lambda e^{[-\tau_1/(t-t_s) - (t-t_s)/\tau_2]}$$

Hakkila and Preece, 2014

A	t_s	τ_1	τ_2	Fluence (erg/cm ²)
20000	-0.1	1	4.5	1.44e-05
9000	-0.1	1	4.5	6.07e-06
5000	-0.1	1	4.5	3.64e-06
2500	-0.1	1	4.5	1.54e-06

$$MWLC = \frac{(LC - Bckgnd)}{\cos(\theta_i) * NDETS * pcode * f(pcode)}$$

Distance Considerations - Results

This is preliminary, to be further investigated at a later time.

Conclusions

T90 may not be an accurate representation of true source duration due to instrumental effects

The T90 is not enough to distinguish between Short and Long GRBs

May be possible to quantify (and correct for) these biases

How are the observed luminosity and T90 distributions affected?

How do other instruments behave?

Thank you!
